Subject: RE: Montana

Hi all (including George Risi),

I spoke this afternoon with George Risi at St. Patrick's Hospital in Missoula Montana.

They are presently meeting to discuss capacity to accept patients at their facility. There facilities under contract with NIH to care for persons at the Rocky Mountain laboratories. A principal issue for them is staffing; the nursing staff is small and there is one infectious disease doctor: Dr. Risi!

I offered that if staffing is the issue limiting their ability to offer capacity for Ebola virus patients, then perhaps we could consider offering some assistance in that area. The promises made but the conversation opened.

Hi Brendan,
The Chinese have an Advanced Team of officials who are doing a fact-finding visit for possible deployment of a medical team for Ebola in Liberia. In addition to visiting ELWA, they requested to visit the CDC lab. They should be at ELWA at about 9 am tomorrow.
Would a visit to the lab be possible?
Thanks!

Subject: RE: Contact for virologist working with Ebola?

Hi Martha,

Nice to hear from you. I will forward your e-mail to the Ebola virology team. You might also consider contacting Dr. Heinz Feldman (feldmannh@niaid.nih.gov) who works with Ebola at the NIH Rocky MTN Labs.

I am here at CDC still working on measles and mumps. How are things at MSU? My nephew is now a freshman at MSU, so I may have to come up for a visit one of these days.

Best regards,

Paul

Subject: Contact for virologist working with Ebola?

Dear Paul,

Serious voice from the past!

My lab is working with a company in Michigan, UrthTech, that makes a range of disinfectants and sanitizers for use in hospitals, on produce, on carcasses, and in homes. My contact, Dr. Aziz Awad, tells me that one of his sanitizers has been shown to work very well on unenveloped viruses, such as norovirus, and that his sanitizer works in the presence of organic material and is more stable than 10% bleach. He wonders whether it would be useful in the Ebola epidemic, and would like to find someone willing to test its efficacy against Ebola virus. I told him that I would contact the two virologists that I know at CDC, you and Ian York, and ask whether you think his sanitizer would be of interest to CDC and who he might contact for some guidance. I will say that we have found his various products to be extremely effective, with one formulation killing *E. coli*, *Pseudomonas aeruginosa*, *Staph. aureus*, and *Enterococcus faecalis* in less than 1 minute (sometimes less than 15 seconds), and another killing anthrax spores in 30-60 minutes.

Hope all is well with you.

Regards,
Martha Mulks

The comparison group is key - ideally, an RCT would be best, but you do not need a placebo - can randomize to standard of care, but need to standardize the clinical care in the study population. Virological monitoring to compare pre-treatment viral load and change in viral load as a secondary outcome with the primary outcome being survival would be highly desirable. Just some quick thoughts.

Subject: Ebola Outbreak Response Monrovia Liberia

Dr. Feldmann,

I am scheduled to leave for Liberia on 10/19/2014 as part of the laboratory component. Is it possible to get a list of the PPE that will be used and protocols for the processes (inactivation, RNA extraction, PCR, etc.) that we will be doing? I have a lot of laboratory experience, and would like to become familiar with specific techniques concerning Ebola laboratory techniques in less than optimal conditions. Thank you for your time and consideration. I look forward to working with you in the near future.

Safe travels to Liberia.

Best regards,

Joshua Self
Microbiologist

Subject: request for Chinese delegation visit to ELWA 3 lab

Hi Brendan,
The Chinese have an Advanced Team of officials who are doing a fact-finding visit for possible deployment of a medical team for Ebola in Liberia. In addition to visiting ELWA, they requested to visit the CDC lab. They should be at ELWA at about 9 am tomorrow.
Would a visit to the lab be possible?
Thanks!
Kris

Thanks Tim for these ideas. Very helpful. With 50% case fatality, the power calculations are simple. We can do this. Chatted with Lu today.

Waiting for Heinz to check with MSF.

Best and thank you for the great info going out and the individual clinician consultation.

There clearly are some therapies that would need to be administered intravenously. But an oral medication is what is needed - assuming the patient is not in the profuse diarrheal phase or vomiting phase - issues with drug absorption. The comparison group is key - ideally, an RCT would be best, but you do not need a placebo - can randomize to standard of care, but need to standardize the clinical care in the study population. Virological monitoring to compare pre-treatment viral load and change in viral load as a secondary outcome with the primary outcome being survival would be highly desirable. Just some quick thoughts.

Awesome, thanks Heinz. I'll share with them. These guys have a pretty incredible setup built into two trucks that are stitched together. Inside they have a BSC and glove box, but also wear full tyvek, PAPR and N95 underneath...very cautious! I think they wanted to remove the inactivation step since its so rate limiting, but their biosafety officer insisted on it since they have no safety test data. Your outline below will be a big help.

As you can imagine CDC has its hands full with this Texas case.

Cheers,

Jon

Vincent or Heinz,

Could one of you sent your extraction SOP you're using in the field for working with Qiagen columns that includes the alcohol step to ensure 100 percent inactivation? I'm here in Sierra Leone and we visited the Chinese lab here outside of Freetown. For RNA extractions they are using Qiagen columns and AVL buffer and an alcohol step, but didn't provide the specifics. I'd like to provide them with the exact same steps you take since I know you've safety tested the process. I'm trying to convince them to remove a 1 hour 60 deg heat inactivation step prior to using the Qiagen kit, but don't have a specific protocol with me to tell them to use that I know is safe. They're probably doing the exact same as you, but I'd like to be sure. Would that be okay?

Many thanks,

Jon

Subject: RE: (SBU) USAID-OFDA West Africa Ebola Outbreak Update

Hello,

From talking with various parties today, including NIH people on CDC sit-reps (produced MWF), which are then sent out to USG partners, should be an easy addition. Those numbers will be included on Monday's report.

On the Embassy issue, because CDC is not making travel arrangements for NIH staff, no one I spoke to has a good handle on who and when NIH people are arriving and leaving Liberia. Two options for connecting to the Embassy might be:

1. NIH connect directly with Dept. of State. Sharon Jackson (jacksonsp@state.gov) is the DoS liaison to CDC right now and could probably help.
2. Or, we can link NIH deployment coordinators and CDC deployment coordinators so they can regularly communicate arrivals of staff

The first option might be the easiest and most flexible, but if the second option is preferred, please let me know and I will find the appropriate people from CDC to connect with.

Thank you,
Beth
